PolymerCeramic with maximum wear resistance against continuous material loss on metallic surfaces

## MultiMetall the MetalExistenceCompany®

PolymerMetall® • MultiMetall® • Ceramium® • Molymetall® • Sealium® • XETEX®

**Technical Data Sheet** 

# **Ceramium**<sup>®</sup>

#### **Product description**

Ceramium offers maximum wear resistance against continuous material loss metallic on surfaces. With tough hard layers, Ceramium protects against erosion. abrasion, cavitation or corrosion

in case of dry or wet or chemical stress.

Ceramium is a two-component-product and it is available in pasty or liquid application consistency.

#### **Technical data**

| A                              |   |                     |  |

| of diamond-equipped tools:     | 3.4 um  |                     |  |
| Density (mixed components):    | $2.03  \text{g/cm}^3$                         |                     |  |

#### Chemical resistance

Already after curing a very good resistance is existent; highest resistance is effected after curing for approx. 6 days at approx. 21°C (alternatively for approx. 4 h at approx. 21°C followed by approx. 15 h at 35 - 40°C). The resistance to chemical stress like acids, caustic solutions, solvents, salts, gases, etc. depends on the concentration, temperature and duration of the exposure. Further details can be given on request.

#### Surface preparation

- Immoderate quantities of salt accumulations in pitting may require wet blasting followed by dry blasting. Alternatively, dry blasting followed by high pressure fresh water cleaning, drying and finally, dry blasting again is possible.
- Mechanically rough up the surface by blasting (it is recommended for blasting to use angular grit material; surface finish approx. 75 µm; purity level approx. Sa 2½ according to Swedish standard SIS 055900 / ISO 8501-1), cutting, grinding...
- Clean by sweeping, blowing off or exhausting
- Thoroughly degrease with MM-Degreaser Z or at least with a good grease dissolver (ethyl acetate, acetone,...); don't use alcohol, benzine or paint thinner
- Apply a thin layer of MM-Release agent on the surfaces, that should not bond with the Ceramium and polish after a short drying period

| Processing data  |          |        |               |
|------------------|----------|--------|---------------|
| Mixing ratio by: |          | Weight | Volume        |
| Ceramium         |          | 100    | 6             |
| Hardener CE      |          | 8      | 1             |
| Tool             |          |        | Measuring cup |
|                  |          |        |               |
| Temperature      | Pot life |        | Curing        |
| 5 °C             | 70 min   |        | 5 days        |
| 15 °C            | 50 min   |        | 2 days        |
| 20 °C            | 35 min   |        | 24 h          |
| 25 °C            | 25 min   |        | 20 h          |
| 30 °C            | 20 min   |        | 18 h          |
|                  |          |        |               |
|                  |          |        |               |

The processing shouldn't be carried out below + 5 °C.

#### **Application instruction**

. . . . . . . . . . . . . .

Before mixing the components the work piece should be prepared in accordance with the surface preparation. Always use clean tools for the removal of the components to avoid a reaction within the tins. We recommend mixing only the quantity of material which can be processed within the pot life.

The available measuring cups can be used to measure the required volume parts of the components. The big measuring cup is for the use of Ceramium, the small cup is for Hardener CE. Measuring cups must be filled to marking.

Under consideration of the mixing ratio the components must be mixed very thoroughly.

Depending on the application consistency the mixture can be applied with a spatula, brush or any other suitable tool by applying, pouring or injecting.

When using a spatula, a brush et cetera, first thoroughly apply a thin layer of the material with pressure onto the work piece to avoid air bubbles in the interface between metal and material ensuring a good surface contact. Immediately afterwards apply the required layer thickness on the still soft material.

All used tools should be cleaned straight after use.

#### **Multiple coating**

| At work piece temperature | apply successive layer after |
|---------------------------|------------------------------|
| approx. 15 - 17 °C        | approx. 3 h 30 min           |
| approx. 20 - 22 °C        | approx. 90 min               |
| approx. 28 - 30 °C        | approx. 80 min               |

At a work piece temperature of 29 °C for example a successive layer should be applied approx. 80 min after mixing the material for the previous layer.

If the previous coating is already partly cured, a surface preparation must be carried out by roughening the previous coating, preferably by careful light blasting, before applying the next coating.

#### Reinforcement

If Fabric tapes or mats made of glass fibre or stainless steel are used optionally, the fabric should be completely coated on both sides and embedded in the PolymerCeramic. Several layers increase strength.

#### Aftercuring

The mechanical, thermal and chemical properties of Ceramium can be improved by aftercuring, when warming up the metallic substrate for approx. 2 hours at approx. 100 °C after partial curing or curing.

#### Wear resistance

Ceramium offers maximum wear resistance against continuing material loss on metallic surfaces.

#### Dry wear test - Test data tribometer:

abrasive paper = silicon carbide paper, grain size 180  $F_N = 60 \text{ N}$  / Turning speed n = 120 U/min / feed v = 1,5 mm/U

This kind of tribological stress during the tests corresponds to the sliding abrasion (three body abrasion, abrasion) according to DIN 50320.

#### Wet wear test - Test data tribometer:

Duration of test 16 h / testing medium water with SiC in different viscosities / grain size 0 - 0,1 mm / temperature appr. 60  $^\circ$ C / turning speed n 1600 U/min

This kind of tribological stress during the tests corresponds to the particle erosion (erosion wear, abrasion) according to DIN 50320.

#### Working security

Avoid eye and skin contact. In case of skin contact, wash thoroughly with soap and water. In case of eye contact, rinse thoroughly with water.

#### Storage

| Product     | Temperature  | Shelf life   |  |
|-------------|--------------|--------------|--|
|             | commendation |              |  |
| Ceramium    | ~ 22 °C      | min. 5 years |  |
| Hardener CE | ~ 22 °C      | min. 5 years |  |

Even after repeated openings of the containers the high quality performance is preserved.
